## 2. News to Report

### a. 6th Workshop on “Nuclear Fission and Spectroscopy of Neutron-rich Nuclei”

This workshop was held at Chamrousse (France) on 20-24th March 2017

<https://indico.ill.fr/indico/event/64/>. The workshop was co-organized by several French laboratories and by the Nuclear Physics Group of the University of York. This workshop brought together the community studying nuclear fission and its applications, and the community performing spectroscopy of neutron-rich nuclei respectively. Close to 90 participants from across the world attended the event.

The workshop was aimed at the presentation of recent experiments, results and ideas for future work on fission and neutron-rich nuclei at existing facilities, etc. using various types of fission experiments as well as beta-decay, isomer, in-beam and laser spectroscopy, lifetime and magnetic moment measurements of neutron-rich nuclei. Fission sessions covered experiments and theory respectively. Emphasis was also put on future studies that are possible at currently existing facilities and with new instruments and facilities such as FIPPS at ILL, NFS and S3 at SPIRAL2, SPES, ARIEL, FRIB, etc. which will open new perspectives over the next few years.

### b. Conference on Applied Radiation Metrology (CARM2017)

We're pleased to announce that the 2017 Conference on Applied Radiation Metrology (CARM2017) will take place at NPL, Teddington, on 7-9 November 2017.

The themes of the conference will include:

- Quality Assurance for radioactivity measurement in the nuclear industry
- Novel technologies (e.g. for radiochemical separation) and measurement techniques, including sampling strategies
- Radiation Protection and the measurement of airborne radioactivity (incorporating IRMF and ARMUG)

If you are interested in giving a presentation at the conference, please contact [NPL events](#) with the provisional title of your talk by **28 April 2017**. This is important for helping us structure the agenda. Note that we welcome progress reports as well as completed projects.

There will also be an industrial exhibition throughout the conference.

Further details and how to register will be available in July.

Contribution by Paddy Regan  
[p.regan@surrey.ac.uk](mailto:p.regan@surrey.ac.uk) (Surrey & NPL)

### c. New ALICE results show novel phenomena in proton collisions

In [Nature Physics](#) the ALICE collaboration reports that proton collisions sometimes present similar patterns to those observed in the collisions of heavy nuclei. This behaviour was spotted through observation of strange hadrons in certain proton collisions in which a large number of particles are created. The observed ‘enhanced production of strange particles’ is a familiar feature of quark-gluon plasma and is commonly created in collisions of heavy nuclei. But it is the first time ever that such a phenomenon is unambiguously

observed in the rare proton collisions in which many particles are created. This result is likely to challenge existing theoretical models that do not predict an increase of strange particles in these events.

The study of the quark-gluon plasma provides a way to investigate the properties of the strong interaction, while enhanced strangeness production is a manifestation of this state of matter. The quark-gluon plasma is produced at sufficiently high temperature and energy density, when ordinary matter undergoes a transition to a phase in which quarks and gluons become 'free' and are thus no longer confined within hadrons. These conditions can be obtained at the Large Hadron Collider by colliding heavy nuclei at high energy. Strange quarks are heavier than the quarks composing normal matter, and typically harder to produce. But this changes in presence of the high energy density of the quark-gluon plasma, which rebalances the creation of strange quarks relative to non-strange ones. This phenomenon may now have been observed within proton collisions as well.

In particular, the new results show that the production rate of these strange hadrons increases with the 'multiplicity' – the number of particles produced in a given collision – faster than that of other particles generated in the same collision. While the structure of the proton does not include strange quarks, data also show that the higher the number of strange quarks contained in the induced hadron, the stronger is the increase of its production rate. No dependence on the collision energy or the mass of the generated particles is observed, demonstrating that the observed phenomenon is related to the strange quark content of the particles produced. Strangeness production is in practice determined by counting the number of strange particles produced in a given collision, and calculating the ratio of strange to non-strange particles.

The Birmingham group played a leading role in the preparation of the results used in this paper.

#### **d. IOP Nuclear Physics conference 2017**

In the first week of April, many from the community gathered in Birmingham for the annual IOP Nuclear Physics conference. As well as interesting talks, including many from students and young post-docs, there was an STFC Town Meeting -- well attended by both the research council and nuclear community. The new CEO of STFC, Brian Bowsher, opened the town meeting, Sean Freeman and Andy Boston gave Science Board and Roadmap updates respectively and Elizabeth Cunningham presented outreach activities.

As well as the usual talk and poster sessions there was a student-focused role-model event with pizza, drinks and the York Lego building blocks all of which elicited very positive feedback from the students attending.

Next year's IOP conference will be organised by the University of the West of Scotland.

#### **e. IOP Early Career Award 2016**

Dr Frank Browne, University of Brighton (now based at RIKEN, Japan), was presented with the IOP Nuclear Physics Group Early Career Award 2016 at the recent IOP conference in Birmingham. Frank then gave an invited talk about his winning research on 'The lifetimes of the first excited 2+ states in neutron-rich Zr-104, 106'.

### 3. Outreach Activity

#### The Naked Scientists go Nuclear

This year we celebrate the 100<sup>th</sup> anniversary of Ernest Rutherford's landmark experiments that established our modern understanding of the atom with a positively charged, heavy and dense nucleus at the centre of the atom surrounded by the much lighter negatively charged electrons. To mark this centenary, the [Naked Scientists](#) produced a radio programme featuring a strong focus on nuclear physics. It went out live on BBC Radio Cambridgeshire, but you can listen to the podcast available at

[https://nakeddiscovery.com/download/audio/Naked\\_Scientists\\_Show\\_17.03.28\\_ad.mp3](https://nakeddiscovery.com/download/audio/Naked_Scientists_Show_17.03.28_ad.mp3).

Starting at the 28:30 minute mark Malcolm Longair covers historical aspects before Paddy Regan (Surrey) and Marialuisa Aliotta (Edinburgh) cover nuclear power and the creation of elements in stars. The program is brought to a close with Rodi Herzberg taking a look at the four new elements named earlier

this year, which complete the 7<sup>th</sup> row of the periodic table.

Continuing this theme Rodi gave a public lecture on "Alchemy in the 21<sup>st</sup> century – A journey to the end of the periodic table" as part of the IoP Nuclear Physics Conference in Birmingham (Monday, 3<sup>rd</sup> April at 19:00, see <http://nuc17.iopconfs.org/home> ).

### 4. Media Interactions

#### The Naked Scientists, Inside the Atom: 100 Years On

Profs. Paddy Regan (NPL& U. Surrey - nuclear power), Marialuisa Aliotta (U. Edinburgh - nucleosynthesis) and Rodi Herzberg (U. Liverpool - Superheavy Elements) were all contributors to the recent specialist Naked Scientists podcast focussing on nuclear physics.

This was first presented live on BBC Radio Cambridge on 26<sup>th</sup> March 2017 and then uploaded as a podcast for the BBC 5 live and Naked Scientists webpage.

Follow the links for the separate podcasts:
